assembly was confirmed by restriction digest.

This finishing standard has slightly changed from the previous Human standard. Specifically, standards for regions of low sequence complexity (such as dinucleotide repeats and small unit tandem repeats) have been relaxed. These regions are very prevalent in the mouse genome, and the return on extended finishing efforts is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       If a sequence meets the criteria of the above statement, it needs no comments or tags. If the criteria are not met, such as ambiguous bases, then the region is duly annotated.
>=30); an attempt was made to resolve all sequencing problems, such
                                                   as compressions and repeats; all regions were covered by at least one plasmid subcitone, fosmid chome or direct clone walk sequence. Sequence from the Mouse Genome Sequencing Consortium whole genome shotgun may have been used to obtain the consensus sequence. The

Tecudar Dovinace; Dovinace Direct Submission
Submitted (01-JUL-2005) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On Jun 28, 2005 this sequence version replaced gi:57900766.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig scaffold'). Within each contig-scaffold individual sequence contigs are ordered and orlented, and separated by sized gaps filled with Ns to the estimated size. The sequence Submitted (19-JAN-2005) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA Cow Genome Sequencing Consortium.                                                                                                                                                                                                                                                                                                                       * NOTE: Bstimated insert size may differ from sequence length
(see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
* NOTE: This is a 'working draft' sequence. It currently
* consists of 13 contigs. The true order of the pieces
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

Submitted (19-Nov-2002) Human Genome Sequencing Center, Department
Submitted (19-Nov-2002) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
On Nov 19, 2002 this sequence version replaced gi:23265004.
The sequence in this assembly is a combination of BAC based reads
and whole genome shotgun sequencing reads assembled using Atlas
(http://www.hgsc.bcm.tmc.edu/projects/rat/). Bach contig described
in the feature table below represents a scaffold in the Atlas
assembly (a 'contig-scaffold'). Within each contig-scaffold,
individual sequence contigs are ordered and oriented, and separated
by sized gaps filled with Ns to the estimated size. The sequence
contigs within a contig-scaffold that consist entirely of whole
genome shotgun sequence reads. Both end sequences and whole genome
shotgun sequence only contigs will be indicated in the feature

NOTE: This is a 'working draft' sequence. It currently consists of 20 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Submitted (01-JUL.2005) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA On Jun 28, 2005 this sequence version replaced gi:58531453.

The sequence in this assembly is a combination of BAC based reads and whole genome shorgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.

Direct Submitted (20-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

Baylor Plaza, Houston, TX 77030, USA

On Nov 20, 2002 this sequence version replaced gi:22857070.

The sequence in this sequence version replaced gi:22857070.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlass (http://www.hgsc.bcm.tmc.edu/projects/rat/). Rach contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig scaffold'). Within each contig scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome

```

```
(http://www.hgsc.bcm.tmc.edu/projects/rat/). Bach contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 9 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as mins of N, but the exact sizes of the gaps are unknown.
This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Assembly program: Alias 3.0;

sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will

```
The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcribtome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several cligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The cligonucleotide libraries are useful for detecting mRNAs from a cultiple contactively or projected sample, in expression profiling studies, in qualitatively or quantitatively characterising the corresponding transcriptom, and in detecting RNA transcripts and splice variants of human or animal contactions. The libraries may also be used as specialised minical contaction of the libraries to detect transcripte of a sub-transcriptom under a particular biological or pathological state, and so allowing the detection of tissue contaction or pathological state, and so allowing the detection of tissue contacts or pathological state, and so allowing the detection of tissue considered a specific genes such as those genes only expressed in specific genes; and to detect RNA transcriptom of a transcriptom of a transcriptom of a partient specific genes; and to detect the sequences from disorder. ABN27253 to ABN59589 represent oligonucleotide sequences from crass, humans and mice, which are used in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format contactly from WIPO at ftp. wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                  New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of genome, useful for detecting tissue-, pathology-, and developmental-

The invention describes a method of determining open reading frames in the genome of organism, comprising contacting mRNA from cell of organism with a single oligonuclectide primer (1) at low stringency, preparing with a single oligonuclectide primer; (1) at low stringency, preparing single-stranded cDNA by reverse transcribing mRNA with (1), amplifying contacting the product, and repeating the contacting, preparing contected and string steps with different primers and sequencing resulting muclectide sequence from a genome of an organism corresponds to an uncleotide sequence from a genome of an organism corresponds to an uncleotide sequence from a genome of an organism, mNAA is obtained from mammalian of nucleotide sequence of an organism mNAA is obtained from mammalian of nucleotide sequence of an organism mNAA is obtained from mammalian or hundle of an organism mNAA is obtained from mammalian or hundle or nucleotide sequence of an organism mNAA is obtained from mammalian or hundle or nucleotide sequence of an organism mNAA is obtained from mammalian or hundle or nucleotide sequence of an organism mNAA is obtained from mammalian or hundle of an organism. MNAA is obtained from mammalian conductions of subjects and can be used to carry our genetic analyses of large or small populations. further, it can be used to study living systems to determine if e.g. there have been genetic shifts which render an individual or population more or less likely to be afflicted with an individual or population more or less likely to be afflicted with the study of whether the conditions are likely to be passed to offending through over or sperm. The analyses for pathological conditions can be strucked to determine if resistance genes are present, defects in plant connective out in all animals, plants, birds, fish, etc. Using this method is also applied to eukaryotic pathogens, such as retroviruses and other integrating viruses such as introvaries and other integrating viruses such as retroviruses and other integrating viruses such

Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder; ss. New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess DNA encoding novel human diagnostic protein #22978 AAS87174 standard; cDNA; 453 BP. 30-MAR-2001; 2001WO-US008631. 31-MAR-2000; 2000US-00540217. 23-AUG-2000; 2000US-00649167. The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed carivity of (II) as useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The copypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in the constant of the product of the prod Claim 1; SEQ ID NO 22978; 103pp; English.

and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

```
The invention describes a method comprising comparing an expression profile of at least one gene in a peripheral blood sample of a patient to at least one reference expression profile of the at least one gene, where the patient has a solid tumour, and each of the gene is differentially expressed in peripheral blood monouclear cells (BMMCs) of a first class of patients as compared to PBMCs of a second class of patients, where continued the first and second classes is a subcluster formed by an ansuparvised clustering analysis of gene expression profiles in PBMCs of a population of patients who have the solid tumour, and where the majority of the first class of patients has a first clinical outcome. Also described are a system comprising (1) a memory or a curcome. Also described are a system comprising (1) a memory or a storage medium including data that represent an expression profile of at least one gene in a peripheral blood sample of a patient who has a solid tumour, (ii) at least one mother storage medium including data that represent a least one peripheral blood sample of a patient who has a solid tumour, (iii) at least one peripheral blood sample of a patient who has a solid tumour capable of comparing the expression profile to the reference expression profile, and (iv) a processor capable of executing the program; where expression levels of the genes, where comparinang concentrated probes for solid tumour prognosis genes is differentially expressed in peripheral blood sample of a second class of patients who have the solid tumour prognosis genes is differentially expressed in peripheral where a solid tumour prognosis genes is differentially expressed in contentrated probes for solid tumour prognosis genes is differentially expressed in peripheral where the first class of patients has a second class of patients has a second class of patients as old tumour, and where the first class of patients has a second class of patients and intention, system, and array are useful for prognosing gene of the invention. The present sequence encodes the canine 574 tumour-associated antigen (TAA). The TAA 574 is a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 574 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been induced were incoulated with a virus expression vector containing the human or murine 574 gene sequence. The 574 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.

The invention comprises a method of detecting a breast cancer-associated transcript in a cell from a patient. The method of the invention involves contacting a blological sample from the patient with a nucleotide that hybridises to one of the 69 breast cancer-associated gene sequences shown in the specification. The method of the invention is useful in the diagnosis or prognosis of breast cancer, and for detecting genes that are up or down-regulated in breast cancer cells. Genes identified by the method of the invention can be used in diagnostic purposes and also as targets for screening for therapeutic compounds that modulate breast cancer (e.g. hormones or antibodies). Identification of genes that are over or under expressed in breast cancer can additionally provide high-resolution, high-sensitivity datasets which can be used in the areas of diagnostics, therapeutics, drug development, pharmacogenetics, protein structure and biosensor development. DNA sequences ABT0763 - ABT07761 represent the 69 breast cancer-associated gene sequences of the invention

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer-associated polynucleotides and polypeptides are used for identifying a compound that medulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a meanmal having lung cancer by administering a medulatory compound identified. The methods are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            for treating lung cancer, such as small cell lung cancer, non-small cell lung cancer or other benign or precancerous lesions, e.g. atelectasis, lung cancer or other benign or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polynucleotides and polypeptides are useful compounds that modulate lung cancer, such as antibodies. Sequences ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the

Ovarian cancer-associated transcript #34.

04-DEC-2003 (first entry)

ADB80503;

```
Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       selectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of detecting an ovarian cancerassociated transcript in a cell from a patient, by contacting a biological sample from the patient with a polymuclecited that selectivel hybridizes to a sequence at least 80% identical to any of one of 80 mucleic acid sequences given in the specification. The method is useful in diagnosing ovarian cancer and in identifying and using agents and/or targets that inhibit ovarian cancer. The nucleic acid molecule, polypeptide and the antibody may also be used in detecting ovarian cancers, monitoring and early detection of relapse following treatment, monitoring response to therapy, selecting mode of therapy, chemotherapy or radiation therapy, in selecting mode of therapy, detectining tumour prognosis, early detection of pre-cancerous lesions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and as vaccines. This sequence corresponds to one of the nucleic acids used for the detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 927 BP; 187 A; 297 C; 240 G; 203 T; 0 U; 0 Other;

of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The invention also relates to expression vectors and host cells comprising a nucleic acid of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and nucleic acids. The nucleic acids, polypeptides, and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease, atherosclerosis, inflammatory diseases, autoimmune diseases, retinal neovascularistaion syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present sequence represents a nucleic acid sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; p53 pathway; Leucine rich repeat capricious related protein;

polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, anti-HIV; cytostatic; antidiabetic; antiasthmatic; cachexia; AIDS; antilnflammatory; cardiant; haemostatic; neuroprotective; anorectic; noctropic; immunosuppressive; osteopathic; antiparkineonian; cancer; antilnfertility; cerebroprotective; gene therapy; NOVX; NOV; fertility; metabolic disorder; diabetes; obesity; infectious disease; anorexis; neurodegenerative disease; Alzheimer's disease; Parkinson's disease; immune disorder; haematopolatic disorder; cardiovascular disorder; bronchial asthma; dyslipidemia; metabolic disturbance; neurogenesis; metabolic syndrome X; wasting disorder; cell differentiation; gene; cell proliferation; haematopolesis; wound healing; angiogenesis; ds.

The present invention relates to new isolated proteins (NOVX) and their coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is sury number from 1 to 48. The NOVX proteins and coding sequences are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The NOVX coding sequences and proteins are useful for treating, preventing or diagnosing diseases such as metabolic disorders, diabetes, obesity, infectious disease, anorexia, cancer-associated cachexia, cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's disease, immune disorders, haematopoietic disorders, cardiovascular

New NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer, Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic disorders, and asthma.

Claim 16; Page 114-115; 619pp; English.

```
disturbances associated with obesity, metabolic syndrome X or wasting distrates associated with chronic diseases or various cancers. The NOVX coding sequences and proteins may also be used as targets for the identification of small molecules that modulate or inhibit e.g. weurogenesis, call differentiation, call poliferation, haematopoiesis, wound healing and anglogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in
fertility, bronchial asthma, AIDS, dyslipidemia, metabolic

Novel canine or feline 574 polypeptide and polynucleotides encoding the polypeptide, useful in preparation of vaccine for treating and/or preventing cancer in a subject, preferably a dog or cat. Claim 4; Page 68; 68pp; English.

The present invention relates to the isolation of canine and feline concofoctal leucine-rich glycoproteins known as F14, and the polymucleotide sequences encoding them. The F14 proteins are expressed in a significant proportion of tumours. The sequences of the invention are

```
useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell proliferation, infections, and inflammatory conditions in animals, proliferation, infections, and inflammatory conditions in animals, preferably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals. The sequences of the invention may also he used in diagnostic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extracts of plasma, urine, tissues, and in cell culture media. Antibodies specific for the 574 protein are useful for isolating foetal cells from maternal blood. The isolation process may form part of a diagnostic method e.g. the foetal cells may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus(es). The present sequence encodes feline 574 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New major histocompatibility complex class I peptide epitopes from human 574 tumor-associated antigen, useful for preventing and/or treating a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel Major Histocompatibility Complex (MHC)

provides a polyapitope string comprising the 5T4 epitope; a nucleic acid sequence encoding the 5T4 epitope or a polyapitope string of the 5T4 epitope, a vector system capable of delivering the 5T4 epitope nucleic acid to a cell; a cell pulsed with the 5T4 epitope, a polyepitope nucleic acid to a cell; a cell pulsed with the 5T4 epitope, a polyepitope of the 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine comprising the above; a method for treating and/or preventing a disease in a subject by administering the vaccine; an agent capable of binding specifically to the 5T4 epitope and/its encoding nucleic acid; a method comprising the presence of the 5T4 epitope or ties encoding nucleic acid; a method comprising the 5T4 epitope in conjunction with an MHC class of molecule. The 5T4 epitope has cytostatic activity. The vaccine is pecifically recognising the 5T4 epitope in conjunction with an MHC class of particularly cancer. The detection method is useful for diagnosing or particularly cancer. The detection method is useful for diagnosing or presence of the 5T4 epitope or its nucleic acid. The T cell line or clone is useful in the manufacture of a cancercous disease, and for detecting the progression of a cancercous disease, and for detecting the progression of a cancercous disease, and for detecting the progression of a cancercous disease, and for detecting the progression of a cancercous disease, and for detecting the progression of a cancercous disease, and for detecting the progression of a cancercous disease, and for detecting the progression of a cancercous disease, and for detecting the progression of a cancercous disease, and for detecting the progression of a cancercous disease, and for detecting the progression of a cancercous disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       gene, ds; feline, Major Histocompatibility Complex class II; MHC; epitope; 5T4 antigen; vaccine; T-cell; cytostatic; cancer; gene therapy.

The invention relates to a Major Histocompatibility Complex (MHC) class II peptide epitope of the 5T4 antigen. The vaccine or T-cell line or clone has a cytostatic activity, as it is useful in manufacturing a medicament for preventing and/or treating a disease, particularly cancer. The methods are useful for detecting T-cells capable of specifically recognising a peptide epitope in conjunction with an MHC molecule, for detecting the presence of a peride or nucleic acid using an agent. The MHC class II peptide epitope of the invention can be used in gene therapy or as part of a vaccine. This polynucleotide sequence represents the DNA coding for the feline 5T4 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.
New Major Histocompatibility Complex class II peptide epitope of 5T4, useful for manufacturing a medicament for diagnosing, preventing and/or treating a disease, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; TAA; tumour-associated antigen; anti-tumour; cytostatic; immunostimulant; vaccine; carcinoma; colorectal cancer; gastric cancer;

carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 574 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been induced were inoculated with a virus expression vector containing the present sequence. The 574 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen [tashed] can be used to elicit an immune response, preferably CIL or an antibody response in a subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Use of single chain antibody capable of recognizing a disease associated molecule for manufacturing a medicament for preventing and/or treating a disease condition associated with disease associated molecule.

The specification describes the use of a single chain antibody (ScFv), which is capable of recognizing a disease associated molecule in the manufacture of a medicament for the prevention and treatment of a disease condition. The ScFv antibody is useful in the manufacture of a disease pharmaceutical composition, for in vivo imaging and/or for adjuvant treatment of a disease. The ScFv antibody is also useful for treating inflammatory diseases including arthritis, hypersensitivity, autoimmune disease, cancers, central nervous system disorders including Parkinson's disease, gastrointestinal disorders, infections, diabetes, Helicobacterrelated diseases, and other immune disorders. The present sequence encodes a 574 protein, which is used to produce ScFv of the invention

The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 574, and the polynucleotide sequences encoding them. The 574 proteins are expressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell composition for the prevention and/or proliferation, infections, and inflammatory conditions in animals, preferably dogs or cats. The compositions may also be used in disgnostic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extracts of plasma, urine, tissues, and in cell culture media. Antibodies specific for the 574 protein are useful for isolating foetal cells from maternal blood. The protein are useful for isolating foetal cells from maternal blood. The cells may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus(es). The present sequence encodes canine 574 protein

Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.

Example 2; Page 78; 79pp; English.

The present sequence encodes the mouse 5T4 tumour-associated antigen (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in

The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system expected a comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a
carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 574 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been induced were inoculated with a virus expression vector containing the present sequence. The 574 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune response, preferably CTL or an antibody response in a subject. The present sequence appears in GenBank at accession number AJ012160
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.

Human bladder cancer associated cDNA sequence SEQ ID NO:192.

(first entry)

12-JUN-2003

ACC51052;

```
The present invention describes a method for detecting a bladder cancerassociated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence that $80 \% identical to a contacting a biological sequence that $80 \% identical to a condectively hybridises to a sequence that $80 \% identical to a concectively hybridises to ACC51059. ACC50951 to ACC51059 encode the human bladder cancer-associated sequences from the present invention have cytostatic activities, and can be used in antisense gene therapy and in vaccine production. The method can be used for detecting a bladder cancer-associated transcript in a cell from a patient. The method is cancer-associated transcript in a cell from a patient. The method is compounds that modulate bladder cancer, such as hormones or antibodies. The mucleic acid molecules from the present invention may be used in various screening and diagnostic methods, and for gene therapy, vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting a bladder cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a bladder cancer-associated polynucleotide or antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 6; Page 296; 307pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mack DH, Aziz N;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      P-PSDB; ABR48236.
```

This invention relates to novel isolated cDNAs that are differentially expressed in MYCN activated cells. Specifically, it refers to polymuclocide sequences that exhibit differential expression patterns in cells activated by the transactivator MYCN, where MYCN is a protonon concern that is amplified in neuroblastoma cells and is common in small concern in hybridisation assays to detect expression of nucleic as useful for in hybridisation assays to detect expression of nucleic acids (or complementary nucleic acids) in a present in a given sample, as well as for screening assays by identifying molecules or compounds that specifically bind the cDNA as a ligand and modulate function or activity. Accordingly, these compositions exhibit cytostatic activity and can also be used for gene therapy purposes. This polymuclecide sequence is a cDNA that is differentially expressed in MYCN activated cells, given in an exemplification of the invention. NOTE: This sequence does not appear in

New genes regulated by MYCN activation, useful in gene therapy, particularly for treating a subject with e.g. neuroblastoma or other cancers, or for diagnosing, staging or monitoring the treatment of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer-associated polymucleotides and polypeptides are used for identifying a compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for tracting a mammal having lung cancer by administering a modulatory compound identified. The methods are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Lung cancer-associated polynucleotide; gene; ds; cytostatic; emphysema; attilifiammatory; autiasthmatic; non-small cell lung cancer; atelectasis; small cell lung cancer; benign lession; precancerous lession; bronchitis; chronic obstructive pulmonary disease; hypersensitivity pneumonitis; interstitial pulmonary fibrosis; fibrosis; asthma; bronchiectasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the patient with a polynucleotide that exhibits increased or decreased expression in lung cancer.

for treating lung cancer, such as small cell lung cancer, non-small cell lung cancer or other benden or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polynucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapoutic compounds that modulate lung cancer, such as antibodies. Sequences ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system modulating a purified Leucine rich repeat, capticious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity where a citizen activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capicious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.

```
the invention or by detecting a polypeptide of the invention. The invention also relates to expression vectors and host cells comprising a nucleic acid of the invention; antibodies which specifically bind a polypeptide of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and nucleic acids. The nucleic acids, polypeptides, antibodies and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart diseasing antibodies and methods are useful for diagnosing, prognosing and treating theroaclerosis, inflammatory diseases, autoimmune diseases, retinal neovascularistation syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present sequence represents a nucleic acid sequence of the invention.
by detecting a nucleic acid at least 80% identical to those of

```
antigenic target (TAT) polynucleotide and polypeptide sequences. Also disclosed is an antibody that binds to a TAT polypeptide. The antibody is a monoclonal antibody, an antibody fragment, a chimeric antibody or a humanised antibody. It is conjugated to a growth inhibitory agent. It is produced in bacteria or in CHO cells and induces death of a cell to which the binds. The antibody is useful for preparing a composition for diagnosing or treating tumours and cancer. The present sequence represents a human TAT cDNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polynucleotides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Wood WI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New PRO nucleic acid or polypeptide, useful for preparing a pharmaceutical composition for diagnosing or treating psoriasis in

Tumour-associated antigenic target (TAT) cDNA DNA103471, SEQ ID NO:2070.
               ACN38510 standard; cDNA; 2053 BP.
                                                                       18-NOV-2004
                                           ACN38510;
                according to prognosts by determining the similarity between the level of expression of each of five genes for which markers are listed in the specification, in a cell sample taken from the breast cancer patient, to control levels of expression for each respective five genes to obtain a patient similarity value. The methods are useful for classifying a breast cancer patient according to prognosis. Kits and computer program products are useful for data analysis using the diagnostic, prognostic and statistical methods of the invention. This sequence corresponds to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of classifying a breast cancer patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Classifying a breast cancer patient according to prognosis comprises determining the similarity between the level of expression of each of five genes in a cell sample taken from patient, to control levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 2053 BP; 461 A; 602 C; 499 G; 491 T; 0 U; 0 Other;

The Invention relates to Annah Cumour associated antigenic target (IATY) oblypeptides, and their related mucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide acquences at least 80% identical to the TAT nucleic acids and polypeptides and polypeptides and polypeptides and polypeptides and polypeptides and polypeptides a peptide or organic acid; an antibody specific for a TAT polypeptide; fusion proteins comprising a TAT nucleic acids, an antibody specific for a TAT polypeptides, nucleic acids, and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, are acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, lung cancer, cancer, bladder cancer, pancreatic cancer, cancer, pancreatic cancer, cervical cancer, cancers of the central nervous system, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human tumour-associated antigenic target (TAT)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New tumor-associated antigenic target polypeptides and nucleic acids, useful in preparing a medicament for treating or detecting a proliferative disorder, e.g. breast, lung, colorectal, ovarian or

This invention relates to a novel screening method identified as a multiparameter high throughput screening (MPHTS) assay. Specifically, it refers to an assay that utilises the disease signature of a plurality of specific genes associated with a particular disease, and identifies differential expression between those cells taken from individuals differential expression between those cells taken from individuals or affected by that disease and those that are not affected. The present invention then describes the screening of candidate pharmaceutical compounds to identify those that have a potential therapeutic benefit for the treatment of neuropsychiatric and neurodegenerative disorders including schizophrenia, bipolar affective disorder (BAD) and autism, well as Parkinson's and Alzheimer's disease. Accordingly, the compounds of this invention exhibit various activities including neuroleptic, noctropic, antimand and antidepressant. Furthermore, the screening method used in MPHTS will be automated, such that a large number of test compounds may be rapidly screened with a minimal amount of labour and effort. This polynucleotide is a human cDNA sequence of a gene that is contracted and average of the presence of a therapeutic compound and accounts and average of the presence of a therapeutic compound and accounts and accounts and average of the presence of a gene that is

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of (II) is useful in gene therapy techniques to restore normal control of (II) is useful in gene therapy techniques to restore normal control of generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in the consisting analysis, genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           to produce other types of data and products dependent on DNA and no acid sequences. AAS64197-AAS94564 represent novel human diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                              ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'-and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length clones were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    830 Primers useful for synthesizing full length cDNA clones and their use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ξ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ota T, Nishikawa T, Isogai T, Hayashi K, Ishii S, Kawai Y;

This invention relates to a novel primers useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This polynucleotide sequence is a full length human cDNA clone of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New oligonucleotide primers (830 cDNAs) useful for synthesizing full
length human cDNAs.

Primers useful for synthesizing full length cDNA clones and their use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to primers for synthesising full length CDNA clones. 830 CDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the CDNA molecules have been determined. Primers for synthesisty the full length cDNA are useful for clarifying the function of the protein encoded by the CDNA. The full length clones were obtained by construction of full length enriched CDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention. Octe: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                          Ë
                                                                                                                                                                                                                                                                                                                                                                                                                          Hayashi K, Ishli S, Kawai Y,

New signal transducer and activator of transcription 6 activation promoting purified protein, for diagnosing and treating disease associated with activation/inhibition of transcription factor e.g. diabetes and cancer

Claim 4; SEQ ID NO 127; 1368pp; English

The invention relates to a purified protein promoting signal transducer and activator of transcription 6 activation (STAT6). The protein is useful for the producing an antibody, which involves administering the protein or its epitope-bearing fragments to a non-human animal as an antigen. The nucleic acid is useful for diagnosing a disease or susceptibility to a disease related to expression a activity of the corporation. The nucleic acid is useful for diagnosing a disease or compounds which inhibit or promote STAT6 activation. A transformant expressing the protein is useful for screening composition. Compositions, antibodies and antisense molecules are useful corposition. Compositions, antibodies and antisense molecules are useful for the treating a disease associated with STAT6 activation such as allowed in for the treating diseases. Compositions are also useful in rheumatoid or treating diseases. Compositions are also useful in rheumatoid arthritis, osteoarthitis, systemic lupus erythematosus, sepsis, asthma, allergic thinitis, ischaemic heart diseases, subarachnoid hasmorrhage, viral hepatitis and AIDS. The protein has efficient promoting STAT6 activities, distinct or nucleic acid is effectively useful for screening compounds for treating and preventing disease associated with excessive human and an arthritis, and an arthritis or inhibition of STAT6. The present sequence represents a human and an arthritis and all preventing disease associated with excessive human and an arthritis and preventing disease associated with excessive human and an arthritis and preventing disease associated with excessive human and an arthritis and preventing disease associated with excessive human and an arthritis and preventing disease associated with excessive human and an arthritis and preventing disease associated with excessive human and an arthritis and preventing disease associated with excessive human and an arthritis and preventing the protein has effectively useful for accepting human and an arthritis and preventing dis activation or inhibition of STAT6. The present sequence represhuman cDNA encoding a protein which promotes STAT6 activation.

Human cDNA

```
This invention relates to a novel primers useful for synthesising full length CDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This polynucleotide sequence is a full length human cDNA clone of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New oligonucleotide primers (830 cDNAs) useful for synthesizing full length human cDNAs.
                                                                                                                                                                                                                               human; medicine; signal transduction; glycoprotein; transcription;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Kawai Y;

for screening The invention relates to a purified protein promoting signal transducer and activator of transcription 6 activation (STAT6). The protein is useful for the producing an antibody, which involves administering the protein or its epitope-bearing fragments to a non-human animal as an antigen. The mucleic acid is useful for disquosing a disease or susceptibility to a disease related to expression or activity of the protein. A transformant expressing the protein is useful for screening compounds which inhibit or promote STAT6 activation. A transformant expressing the protein is useful for producing a pharmaceutical composition. Compositions, antibodies and antisense molecules are useful for the treating a disease associated with STAT6 activation such as allergic diseases, inflammation, autoimmune diseases, diabetes, the profit diseases, inflammation, autoimmune diseases, diabetes, dispersiplidaemia, infections disease and cancers. Compositions are useful for treating disease ascolated with STATE activation and/or prevention of Thi hyperactive diseases. Compositions are also useful in rheumatoid arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma, allergic rhinitis, ischeemic heart diseases, subarachnoid haemorrhage, viral hepatitis and AIDS. The protein has efficient promoting STATE activity. The protein or nucleic acid is effectively useful for screening compounds for treating and preventing disease associated with excessive activation or inhibition of STATE. The present sequence represents a human cDNA encoding a protein which promotes STATE activation.

allergic diseases, inflammation, autoimmune diseases, diabetes, hyperlipidaemia, infections disease and cancers. Compositions are useful for treating disease associated with STATS activation and/or prevention of Thi hyperactive diseases. Compositions are also useful in rheumatoid arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, athmat allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage, viral hepatitis and AIDS. The protein has efficient promoting STATS

```
The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species, to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypoptides encoded by the genes. Antibodies (Ab) raised against the optypoptides encoded by the genes. Proteins, Ab and cells that carry a gene-containing vector are used to select compounds that andulate, regulate, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. Iuminescens. Cells transformed to express the genes are useful for recombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The
activity. The protein or nucleic acid is effectively useful for screening compounds for treating and preventing disease associated with excessive activation or inhibition of STATE. The present sequence represents a human cDNA encoding a protein which promotes STATE activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antibacterial; fungicide; insecticide; polymorphism; genetic analysis; detection; food; gene expression; plant; animal; microorganism; toxin; antibiotic; biopesticide; virulence factor; disease model; plague;

genes, proteins, vectors containing the genes and Ab are also useful therapeutically (to treat microbial infection by bacteria or fungi that ser sensitive to P. luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens genes

The polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomanna, lighin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of homologous photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake the contract of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert polynucleotide that can be used in the recombinant DNA construct of the

       The invention also relates to a peptide array comprising two or more nucleic acid probes.

The invention also relates to a peptide array comprising two or more isolated polypeptide, an isolated acid sequence, a compound that binds to a polypeptide, an isolated acid sequence, a compound binds to a polypeptide, which is prepared by immunizing a host animal composition comprising the polypeptide or its antigen binding the polypeptide or its antigen binding fragment and collecting calls from the host expressing antibodies against the antigen or its antigen binding fragment, a composition comprising the antibody and a carrier, a method of sereening for anticancer activity, a method of treating cancer and a method of inhibiting expression of a CA nucleic acid. A mucleic acid, a method of diagnosing cancer, a method of treating cancer and a method of inhibiting expression of a CA nucleic acid. The CA nucleic acids are useful for detecting CA nucleic acids. The antibody and detecting the presence or absence of cancer cells in an individual which involves contacting cells from the cancer cells and the antibody where the detection of the complex correlates with the presence of cancer cells in the individual. The composition is useful for inhibiting growth of cancer cells in an individual or for delivering a therapeutic agent to cancer cells in an individual. The invention is also useful for diagnosing cancer, for treating cancer and for inhibiting expression of a CA gene in a cells in an individual or for inhibiting expression of a CA gene in a cells in an individual or for inhibiting expression of a CA gene in a cells in an individual or for inhibiting expression of a CA gene in a cells in an individual or for inhibiting expression of a CA gene in the interaction of a cells in the cancer and for inhibiting expression of a CA gene in the cancer of a cancer of a cells in the cancer and the cancer associated genomic DNA of a cancer and a cancer a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    recombinant DNA construct; physical array; plant breeding marker; cold tolerance; heat tolerance; drought tolerance; herbicide tolerance; extreme osmotic condition; pathogen tolerance; pest tolerance; growth rate; cell cycle pathway; disease resistence; galactomannan production; lignin production; plant growth regulator;
                                                                                                                                                                                                                                                                                                                                                                                                cancer associated nucleic acid,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 117730 BP; 32629 A; 25620 C; 25334 G; 34147 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a nucleic acid array for detecting a cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              plant protectant; plant growth regulant; gene therapy; plant;

                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to novel sequences which are useful for preparing composition for diagnosing or treating carcinomas. These sequence are also useful in gene therapy. The present sequence is human CCND1 carcinoma associated (CA) gene. This sequence is used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New recombinant nucleic acid encoding carcinoma associated protein,
                                                                                                                                                                                                                                                                                                               New recombinant nucleic acid and its encoded protein, useful for preparing a composition for diagnosing or treating carcinomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 30346 BP; 6484 A; 8431 C; 8729 G; 6702 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human CCND1 carcinoma associated gene, SEQ ID NO:980.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence encodes a leptin receptor (OB-R) protein, OB-Rb. The OB-R can be used to treat obesity, optionally in conjunction with a treatment for diabetes, high blood pressure and high cholesterol, or in ossmetic compositions for reducing body weight. It may also be used in agriculture to produce leaner food animals, e.g. beef cattle, swine poultry, sheep. An antibody specific for OB-R can be used to measure the presence of OB-R in a sample, optionally in vivo, while the nucleic acid molecule encoding OB-R can be used to detect defects in the OB-R polypeptide associated with obese phenotypes, or diagnostically to massure its encoded RNA and protein in nutritional disorders. The nucleic acid molecule can be used in gene therapy, or the antisense nucleic acid molecule, can be used to treat weight loss e.g. associated with AIDS, cancer or anorexia nervosa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Carcinoma; gene therapy; carcinoma associated gene; CA; CCND1; human; ds.

The invantion relates to recombinant carcinoma associated (CA) nucleic acid sequences from mouse and human (ADA01482-ADA03094), and to recombinant carcinoma associated proteins (CAP) encoded by them. The invention also encompasses expression vectors and host calls comprising a CA nucleic acid, a polypeptide (sepecially an antibody) that specifically binds to the protein, and a biochip comprising CA nucleic acid or fragments thereof. The sequences of the invention were identified using oncogenic retroviruses, which insert into the genome of the host organism at random. Many of these do not carry transduced host oncogenes or direct consequence of the effects of proviral integration into host proteoncogenes. The CA nucleic acid sequences can be used to diagnose carcinoma (especially breast cancer, prostate cancer, lymphoma or leukaemia) or a propensity to carcinoma by determination of the sequence of a CA gene, or by determination of CA gene expression in particular thereby account sequence acids, proteins and antibodies are also useful as therefore a specially seart of the protein and antibodies are also useful as present sequence of the invention. Note: The complete sequence data for this patent of the printed specification, but was obtained in all particul forms.
useful for preparing compositions for treating carcinomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        format directly from WIPO at

The invention comprises human and mouse cancer-associated nucleic acid sequences. The cancer associated nucleic acids of the invention are useful for screening for anticancer activity in a potential drug, as well as detecting, diagnosing, preventing and treating cancers (e.g. lymphoma, leukaemia, or breast cancer). The present sequence represents a cancer-
                                                                                                                              The invention relates to a novel recombinant nucleic acid comprising a nucleotide sequence selected from any of the 660 sequences fully defined in the specification. A polynucleotide of the invention has cytostatic activity, and may have a use in gene therapy, or in a vaccine. The recombinant nucleic acids and polypeptides are useful for treating
                                                                                                                                                                                                                   carcinomas, e.g. lymphomas, cancers, neoplasm, adenocarcinoma, and sarcomas. The present sequence represents a human gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New cancer-associated proteins and nucleic acids, useful for screening for anticancer activity in a potential drug, or for detecting, diagnosing, preventing and treating cancers, e.g. lymphoma, leukemia or

The invention also relates to a matched for treating cancers involving administering to a patient an inhibitor of CAP, and a method of screening for anticancer activity in a potential drug involving providing a cell that expresses a CA gene, contacting a tissue sample derived from a cancer cell with an anticancer drug candidate and monitoring the effect of the anticancer drug candidate and monitoring the CAP proteins are useful for detecting cancer associated with expression of a CAP protein in a test cell sample and for screening for a bioactive agent capable of modulating the actisue. This sequence represents a murine CA gene of the involving determining the expression of a CAP nucleic acid in a cissue. This sequence represents a murine CA gene of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mouse; cancer-associated protein; CAP; cancer-associated gene; CA; gene; ds; cancer; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel human cancer associated protein encoded within open reading frame of cancer associated gene, useful as targets for diagnosing cancer.

The present sequence describes a purified corn tassel-derived polynucleotide sequence (cdps) comprising a nucleic acid sequence selected from those given in ABL70627 to ABL70633. The cdps sequences can calculate from those given in ABL70627 to ABL70633. The cdps sequences encode corn tassel-derived polypepides (CDPs). The cdps sequences (I) can be used for determining altered gene expression, to recover regulatory elements and to follow inheritance of desirable characteristics through hybrid breeding programs. (I) are also useful in the evaluation, and alteration of desired characteristics associated with growth and development, disease resistance, environmental adaptability, calculated and semilatoral markers for studying inheritance of multigene traits in a plant breeding program. (I) can be used to produce a tassel-specific profile of gene transcription, a transcript image, to concept equality equality isolate or extend identical or related corn tassel nucleic acid sequences from DNA libraries, in nucleic acid sequences from DNA libraries, in nucleic acid determine homology of known sequences, as guery sequences to determine homology of known sequences, as probe for use in Southern or Northern hybridisation, and to identify the presence of and/or to concept and the degree of similarity between two (or more) nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel purified corn tassel-derived polynucleotide useful for determining
